Wood Handbook--Chapter 4--Mechanical Properties of Wood  
As you would expect, wood has both physical and chemical properties. Physical properties comprise of the density of wood, the texture, moisture content, shrinkage effect, deformation, splitting, strength, hardness, stiffness and thermal transferability. The appearance of wood is determined by its shade, shine, grain, lustre and structure.

planks. It is also known as "lumber" in US and Canada. Basically, timber or Lumber is a wood or firewood of growing trees. Any wood capable of yielding a minimum dimensional size can be termed as a timber or lumber. It is a stage in the process of wood production.

Properties of Timber - Qualities of Good Timber & Wood ...

Good silviculture practices affect wood properties. In softwoods, good thinning and proper spacing can enhance growth rates, strength, and other properties. Moreover, spacing can be tailored to the targeted product. For pulpwood species, proper spacing can produce high quality fibre and yield which may not be the same as high volume.

3.3 PHYSICAL PROPERTIES OF WOOD Physical properties describe the quantitative characteristics of wood and its behavior to external influences other than applied forces. Included are such properties as moisture content, density, dimensional stability, thermal and pyrolytic (fire) properties, natural durability, and chemical resistance.
